

My friends want to have a silly ring party. They want to put rings on every finger and every thumb at the party.

Every one of my friends has ten fingers if I include their thumbs in the count.

Every finger must have exactly one ring on it.

Choose a number of friends and tell me how many fingers there are so that I will know how many rings to buy at the dollar store for the party.

Show your work.

You need to buy _____ rings.

If they sell rings in bags at the dollar store and there are 5 rings for one dollar, how many bags of rings will I need to buy? Show how you know.

If every friend only got 5 rings, then how many bags of rings would I need to buy? Show how you know.
